

Studying isn't one chat with one PDF.

Material scattered across PDFs, scanned notes, textbooks, Calibre, and Zotero. Existing AI tools chat with one document and forget you when the tab closes — no quizzing, no weak-point tracking, no continuity.

A terminal-native study cockpit, not another chat-with-PDF app.

Load a real document. Ask grounded questions. Get quizzed on what you don't know. Turn misses into flashcards. Save notes, export, and come back later — your weak points remembered.

01 / Load

Bring your library

PDFs, image notes, OCR-aware. Calibre and Zotero plug in.

02 / Ask

Grounded chat

BM25 retrieval over loaded docs. Answers cite the page.

03 / Quiz

Weak-point hunt

Interactive quizzes target what you've actually missed.

04 / Return

Progress remembered

Misses become flashcards. Notes, summaries, exports persist per document.

```
study > load chapter 1 physics
study > what are the main ideas here?
study > quiz me on the weak points
study > make flashcards from the misses
study > how am i doing on this chapter?  # picks up next session
```

Five real subsystems — not a wireframe.
